[^] $p < 0.10$, * $p < 0.05$, ** $p < 0.01$

Cross-sectional OLS regression with standard errors in parentheses. The dependent variables are Roads (% of roads that are paved), Water (% of population with access to an improved water source), Hospitals (number of hospital beds per 1,000 people), Doctors (number of physicians per 1,000 people), Mort5 (under-5 mortality rate), and LifeExp (level of life expectancy). The independent variables are GDP/cap₆₀ (log level of GDP per capita in 1960), Democracy (mean level during the period 1960-2007), TaxRev (mean level of tax revenue as a percentage of GDP over the period 1960-2007), and StateHist. These tests indicate that StateHist has a strong effect on several indicators of public service delivery even after controlling for initial country wealth, the level of democracy over a long period, and the level of tax revenue.

Figure S2: Marginal Effect Plots of RationalLegal and Checks on Growth Factors

(a) This figure shows the effect on the capital stock growth rate from a one-unit change in RationalLegal at different levels of Gap according to the estimates in Table 1, Model 5. The dotted lines represent the 95% confidence interval.

(b) This figure shows the effect on the productivity growth rate from a one-unit change in RationalLegal at different levels of Gap according to the estimates in Table 2, Model 5. The dotted lines represent the 95% confidence interval.
